

**We Fix Stressed Trees
from the Inside—Out...and
Coming from the Tree's
Point of View**

THREE OR MORE STRESSES LEAD TO DECLINE

- Current conditions: too hot-cold-wet-dry, poor lighting, flooding, standing water, long drought, etc., or some combination.
- Multiple season and multiple year stresses that accumulate: *i.e. summer drought followed by extreme winter cold and/or a cold, wet spring followed by extreme heat. Lightening hits! Splitting.*
- Human factors: *"volcano" mulch piles, digging or piling soil at base, transplanting, improper pruning, bands left on trunk, construction & compacted soil, removing Autumn leaves, originally planted too deep, changes in topography or land grade, hit by car, abuses like carving, "topping," road salt, etc.*
- Poor soil composition, fertility or drainage.
- Competition from "weeds" or desired plants.
- Animal damage: *chewing, digging, rubbing, eating, tunneling, soiling, climbing, etc.*
- Excess or inappropriate use of any product (*i.e. harsh fertilizers or protective sprays*) or invasive technique (*i.e. air spading, harsh pruning*)
- Pollution of soil, air or water.
- Global environmental or climate changes. *For example: differences in rainfall amounts, change of season length, changes in insect/disease survival, changed composition of local eco-system (i.e. invasive or non-native plants) changes in average temperatures or higher night-time temperatures, changes in level of water table, etc.*
- Complication of added stresses during or after issues like poor soil fertility, insect attack or diseases.
- Combinations of any of the above.
- And, as a vicious cycle! Uncorrected stresses open the door to more insects, more disease and additive dysfunctions inside tree or plant.

If your trees are stressed, call us. It's a service—not a product. Safe! Easy. Effective. Stressed trees and plants can recover full health or reverse their decline.
